Architectural Masonry Units
- Finish Overview -

GEMSTONE® ground face masonry units feature a milled finish that exposes the natural aggregates in the CMU. Then, a heat-polymerized acrylic is factory-applied to enhance the natural beauty of the aggregates.

RUSTIC FACE units feature a textured face generated by shotblasting the unit surface, producing a weathered, rustic appearance. Provides a softer look than Gemstone, but a smoother look than Split Face.

TEMPLE STONE® delivers an appearance similar to Jerusalem Limestone, providing a smooth, flat, relief with concave, craggy elements. This finish, without convex edges that can scratch or scrape against clothing, is perfect for lobbies, hallways or other high-traffic areas.

SPLIT FACE concrete masonry units offer a uniquely textured face where no two units are alike, offering aesthetic depth to building design. After the unit is cured, it is run through a splitting device, fracturing the face aggregates, providing a rough, craggy texture.
