

CLEAN-COAT™ CMU

CMU for High-Performance Cleanroom Applications

CLEAN-COAT™ masonry units are manufactured with a special mix design to deliver a tighter face matrix. This provides an ideal substrate for the application of specialized coatings. Perfect for use in cleanroom environments (for specialized industrial production or scientific research), where a less porous face texture is required.

It's also great for food processing plants, food preparation areas like commercial kitchens, as well as research labs, veterinary facilities and hospitals.

Units meet ASTM C 90 specifications, and are available in common masonry shapes and sizes.

- Saves time and labor by minimizing need for block filler layers with traditional CMU prior to coating or painting.
- Coated/painted Clean-Coat™ units are notably less expensive than alternate applications for cleanroom needs, such as tile or glazed CMU.
